

Your website feels fast to you. That's the problem.

Why owners are the last to know their site is slow

You've seen it before.

They haven't.

Your browser keeps saved copies of your site, so it loads instantly for you. First-time visitors download everything cold — usually on a phone, on mobile data.

Heavyweight images

A photo uploaded straight from a camera can weigh more than the rest of the page combined. Compressing it costs nothing, and nobody sees the difference.

Add-on overload

Chat widgets, trackers, sliders, pop-ups — every extra ships code your visitor has to download before the page settles down.

Culprit 3: no caching, no CDN

Your server rebuilds the page for every single visitor. A CDN serves a ready copy from somewhere near them instead.

Why it's worth fixing

Trust signals

People decide whether a site feels trustworthy within the first seconds.

Ranking signals

Google uses page speed as a ranking signal. A slow site loses visitors it never even meets.

Test it like a stranger

Private window

- Open your site in a private window, on your phone, on mobile data.

PageSpeed Insights

- Or run it through PageSpeed Insights, free. That's the version first-time visitors actually get.

Speed is part of the design

It shapes the first impression before a single word gets read. Not sure what's slowing your site down? Send Night Ace the link — we'll answer in plain language.
